A fictitious force (also called a pseudo force, d'Alembert force, or inertial force) is an apparent force that acts on all masses whose motion is described using a non-inertial frame of reference, such as a rotating reference frame. Examples are the forces that act on passengers in an accelerating or braking automobile, and the force that pushes objects toward the rim of a centrifuge.

Simple gravity pendulum. The simple gravity pendulum is an idealized mathematical model of a pendulum. This is a weight (or bob) on the end of a massless cord suspended from a pivot, without friction. When given an initial push, it will swing back and forth at a constant amplitude. Real pendulums are subject to friction and air drag, so the amplitude of their swings declines.

Why Gravity Causes Things to Fall. If something is dropped, why does it fall? GRAVITY is the reason, of course, but why? What is it about gravity that causes things to drop to the ground?

Section 2: Gravity Surveying. Introduction. Gravity surveys measure the acceleration due to gravity, g . Average value of g at Earth's surface is 9.80 ms^{-2} . Gravitational attraction depends on density of underlying rocks, so value of g varies across surface of Earth.

5.1 Newton's laws of motion. English natural philosopher Isaac Newton unified German astronomer Johannes Kepler's laws of planetary motion (discussed in Chapter 3) with Italian natural philosopher Galileo Galilei's theory of falling bodies (discussed in Chapter 4). Newton published his laws of motion and universal gravitation in *The Mathematical Principles of Natural Philosophy*, commonly ...

Coulomb's Law Equation. The quantitative expression for the effect of these three variables on electric force is known as Coulomb's law. Coulomb's law states that the electrical force between two charged objects is directly proportional to the product of the quantity of charge on the objects and inversely proportional to the square of the separation distance between the two objects.

Without getting too much into the technical details, there are two bulges because of the differential gravitational forces. The liquid at point A is closer to the Moon and experiences a larger gravitational force than the Earth at point B or the ocean at point C.

PROJECTILE MOTION We see one dimensional motion in previous topics. Now, we will try to explain motion in two dimensions that is exactly called "projectile motion". In this type of motion gravity is the only factor acting on our objects. We can have different types of projectile type. For example, you throw the ball straight upward, or you kick a ball and give it a speed at an angle to the

Impeded Magic. Particular spells and spell-like abilities are more difficult to cast on planes with this trait, often because the nature of the plane interferes with the spell.. To cast an impeded spell, the caster must make a Spellcraft check (DC 20 + the level of the spell). If the check fails, the spell does not function but is still lost as a prepared spell or spell slot.

Use the -filter to choose a different resampling algorithm. Offsets, if present in the geometry string, are ignored, and the -gravity option has no effect.
