Solving Exponential And Logarithmic Equations

In this section we will discuss a couple of methods for solving equations that contain logarithms. Also, as we'll see, with one of the methods we will need to be careful of the results of the method as it is always possible that the method gives values that are, in fact, not solutions to the equation.

Algebra - Solving Logarithm Equations

Solving logarithmic equations usually requires using properties of logarithms. The reason you usually need to apply these properties is so that you will have a single logarithmic expression on one or both sides of the equation. Once you have used properties of logarithms to condense any log expressions in the equation, you can solve the problem by changing the logarithmic equation into an ...

1. To solve a logarithmic equation, rewrite the equation in exponential form and solve for the variable. Example 1: Solve for x in the equation $\ln(x)=8$. Solution: Step 1: Let both sides be exponents of the base e . The equation $\ln(x)=8$ can be rewritten . Step 2: By now you should know that when the base of the exponent and the base of the logarithm are the same, the left side can be written x .

Many applications involve using an exponential expression with a base of e . Applications of exponential growth and decay as well as interest that is compounded continuously are just a few of the many ways e is used in solving real world problems. Because it is treated as a number (and not as a variable), all the rules of exponents apply to e as it does any other exponential expression.
