Fundamentally, a CANDU nuclear power plant generates electricity like most "thermal" electricity stations (i.e. those that use heat), which includes fossil-fuelled stations as well as most other commercial nuclear stations in the world: Heat is used to boil water, which turns to high pressure steam, which flows through a turbine, which turns an electrical generator, which makes electricity.

When solar energy drives the dissociation of CO₂ and H₂O, the fuel cycle is comparable to that of biofuels: synthetic "trees" collect CO₂ from the air and use solar energy to fix it as carbon (). However, this fuel cycle avoids the biomass intermediate product, which consumes a lot of resources to cultivate (water, fertilizer, etc) and needs to be processed further to produce a fuel.
