DC Circuits. EXAMPLE PROBLEM ON RESISTORS IN SERIES. Question The current flowing in a circuit containing four resistors connected in series is $I = 1.0$ A. The potential drops across the first, second and third resistors are, respectively: $V = 5$ V, $V = 8$ V and $V = 7$ V. The equivalent resistance of the circuit is $R = 30$.

A common problem that many resistors face is the danger of burning out. A resistor burns out for the same reasons that electrical light bulbs do. It could be because the resistor has encountered

high voltage, there is too much electricity flowing through it or simply because it has overheated.

Resistor Problems? Questions on Resistor Problems Answered

In one problem, the resistor values may be given and the current in all the branches are the unknown. In another problem, the current in the battery and a few resistor values may be stated and the unknown quantity becomes the resistance of one of the resistors. Different problem situations will obviously require slight alterations in the ...
