There are various mathematical descriptions of the electromagnetic field that are used in the study of electromagnetism, one of the four fundamental interactions of nature. In this article, several approaches are discussed, although the equations are in terms of electric and magnetic fields, potentials, and charges with currents, generally speaking.

A differential equation is a mathematical equation that relates some function with its derivatives. In applications, the functions usually represent physical quantities, the derivatives represent their rates of change, and the differential equation defines a relationship between the two.

A Lorentz transformation is a four-dimensional transformation $x'^{\mu} = \Lambda^{\mu}_{\nu} x^{\nu}$, (1) satisfied by all four-vectors x^{ν} , where Λ^{μ}_{ν} is a so-called Lorentz tensor. Lorentz tensors are restricted by the conditions $\Lambda^{\alpha}_{\gamma} \Lambda^{\beta}_{\delta} \eta^{\gamma\delta} = \eta^{\alpha\beta}$, (2) with $\eta_{(\alpha\beta)}$ the Minkowski metric (Weinberg 1972, p. 26; Misner et al. 1973, p. 68).

The late J.J. Sakurai, noted theorist in particle physics, was born in Tokyo, Japan in 1933. He received his B.A. from Harvard University in 1955 and his PhD from Cornell University in 1958. He was appointed as an assistant professor at the University of Chicago, where he worked until he became a professor at the University of California, Los Angeles in 1970.

A partial differential equation (or briefly a PDE) is a mathematical equation that involves two or more independent variables, an unknown function (dependent on those variables), and partial derivatives of the unknown function with respect to the independent variables. The order of a partial differential equation is the order of the highest derivative involved.

Exemples. Illustrons la notion de « transport d'énergie sans transport de matière ». Dans le cas d'une onde mécanique, on observe de petits déplacements locaux et éphémères des éléments du milieu qui supportent cette onde, mais pas de transport global de ces éléments. Il en est ainsi pour une vague marine qui correspond à un mouvement approximativement elliptique des particules d

C'est incontestablement la résolution du problème du rayonnement du corps noir qui a marqué le début de la mécanique quantique. Au début du XX^e siècle, Max Planck résout en effet ce problème en faisant l'hypothèse que l'énergie des atomes ne peut s'échanger que par multiples de quantités proportionnelles à la fréquence du rayonnement, selon la formule désormais célèbre :
