$\triangle ABC$ is an equilateral triangle with side 6. Equilateral triangles have sides of all equal length and angles of 60° . To find the area, we can first find the height. To find the height, we can draw an altitude to one of the sides in order to split the triangle into two equal 30-60-90 triangles. Now ...

While redshift can be used to tell us about the recession velocity of (non relativistic) galaxies, we also need to find a way to measure the distance to these galaxies. Astronomers have two main

methods to measure these distances; parallax (more parallax here) and cepheid variable stars – there's a Khan Academy video on cepheid variable stars.
