What is it? Based on computational physics, Energy2D is an interactive, visual multiphysics simulation program that models all three modes of heat transfer—conduction, convection, and radiation, and their coupling with particle dynamics. Energy2D runs quickly on most computers and eliminates the switches among preprocessors, solvers, and postprocessors typically needed to perform ...

Aerodynamics, from Greek ἀήρ aer (air) + δυναμική (dynamics), is the study of motion of air, particularly as interaction with a solid object, such as an airplane wing. It is a sub-field of fluid dynamics and gas dynamics, and many aspects of aerodynamics theory are common to these fields. The term aerodynamics is often used synonymously with gas dynamics, the difference being that ...

Before the the introduction of bottom-side preheating stations in the early 1990's, two of the most critical processes which are instrumental to successful SMT & BGA tasks at the bench were previously the two most commonly neglected: 1) Properly preheating the printed circuit board (PCB) before attempting reflow, and 2) Initiating a quick "cool down" of the solder joints after reflow.
