In control theory, a causal system (also known as a physical or nonanticipative system) is a system where the output depends on past and current inputs but not future inputs—i.e., the output ( $y(t)$ ) depends on only the input ( $x(t)$ ) for values of  $t \leq t$ . The idea that the output of a function at any time depends only on past and present values of input is defined by the property commonly referred to as ...

A time-invariant (TIV) system has a time-dependent system function that is not a direct function of time. Such systems are regarded as a class of systems in the field of system analysis. The time-dependent system function is a function of the time-dependent input function. If this function depends only indirectly on the time-domain (via the input function, for example), then that is a system ...

Introduction. The correlation between two signals (cross correlation) is a standard approach to feature detection [6,7] as well as a component of more sophisticated techniques (e.g. []). Textbook presentations of correlation describe the convolution theorem and the attendant possibility of efficiently computing correlation in the frequency domain using the fast Fourier transform.
