Before the the introduction of bottom-side preheating stations in the early 1990's, two of the most critical processes which are instrumental to successful SMT & BGA tasks at the bench were previously the two most commonly neglected: 1) Properly preheating the printed circuit board (PCB) before attempting reflow, and 2) Initiating a quick "cool down" of the solder joints after reflow.

Countercurrent exchange along with cocurrent exchange and contra-current exchange comprise the mechanisms used to transfer some property of a fluid from one flowing current of fluid to another across a barrier allowing one way flow of the property between them. The property transferred could be heat, concentration of a chemical substance, or other properties of the flow.

All electronic devices and circuitry generate excess heat and thus require thermal management to improve reliability and prevent premature failure. The amount of heat output is equal to the power input, if there are no other energy interactions. There are several techniques for cooling including various styles of heat sinks, thermoelectric coolers, forced air systems and fans, heat pipes, and ...
