Software. We estimate that well over 80% of CPU cycles spent in ab initio computations are used in optimizing geometries at the SCF or DFT levels, and in computing molecular properties, such as vibrational frequencies and NMR chemical shifts. Such calculations are extremely well suited for parallel implementation. Shifting them to an inexpensive and fast parallel machine can free up expensive ...

In chemistry, resonance is a way of describing bonding in certain molecules or ions by the combination of several contributing structures (or forms, also variously known as resonance structures or canonical structures) into a resonance hybrid (or hybrid structure) in valence bond theory. It has particular value for describing delocalized electrons within certain molecules or polyatomic ions ...

We attempted to establish a new photorespiratory bypass that converts glycolate to CO₂ via three rice-self-originating enzymes. As illustrated in Figure 1A, in this bypass glycolate is first oxidized to oxalate in two steps by OsGLO3, an isoform of glycolate oxidase in rice that was shown to effectively catalyze the oxidation of both glycolate and glyoxylate (Zhang et al., 2012).
