Stochastic is synonymous with "random." The word is of Greek origin and means "pertaining to chance" (Parzen 1962, p. 7). It is used to indicate that a particular subject is seen from point of view of randomness. Stochastic is often used as counterpart of the word "deterministic," which means that random phenomena are not involved. Therefore, stochastic models are based on random trials, while ...

A stochastic differential equation (SDE) is a differential equation in which one or more of the terms is a stochastic process, resulting in a solution which is also a stochastic process. SDEs are used to model various phenomena such as unstable stock prices or physical systems subject to thermal fluctuations. Typically, SDEs contain a variable which represents random white noise calculated as ...

Introduction. A random event is any event which has a chance of happening. Probability is the measure of that chance. Random variables are functions which receive a random event and return a real number. Random variables may be discrete or continuous; discrete random variables are

ones with a countable number of possible outcomes; continuous random variables are ones which have an infinite ...

Note that by introducing a new constraint if necessary, we can always take the objective function to have no uncertainty. The goal of (2.1) is to compute minimum cost solutions x^* among all those solutions which are feasible for all realizations of the disturbances u_i within U_i . If U_i is a singleton, then the corresponding constraint has no uncertainty.
