Enhanced biological phosphorus removal (EBPR) is a sewage treatment configuration applied to activated sludge systems for the removal of phosphate.. The common element in EBPR implementations is the presence of an anaerobic tank (nitrate and oxygen are absent) prior to the aeration tank. Under these conditions a group of heterotrophic bacteria, called polyphosphate-accumulating organisms (PAO ...

Applications Pretreatment. Before the water enters the clarifier, coagulation and flocculation reagents, such as polyelectrolytes and ferric sulfate, can be added. These reagents cause finely suspended particles to clump together and form larger and denser particles, called flocs, that settle more quickly and stably.

The detection and quantification of Legionella in wastewater is challenging because of the complex chemical and biological composition of the wastewater matrix in comparison to drinking water. Currently, there are several methods for Legionella quantification, but most of the studies that investigated the occurrence of Legionella in WWTPs (as shown in Table 1, Table 2) used the culture method ...
