Newton's method, also called the Newton-Raphson method, is a root-finding algorithm that uses the first few terms of the Taylor series of a function  $f(x)$  in the vicinity of a suspected root. Newton's method is sometimes also known as Newton's iteration, although in this work the latter term is reserved to the application of Newton's method for computing square roots.

This formulation applies to any imaging modality (e.g., electron microscopy (EM) and scanning electron microscopy (SEM), where the MVF and AVF can be measured after segmentation of the image - see Fig. 1), but it is of particular interest to be able to estimate the g-ratio in vivo. MRI provides us with several different contrast mechanisms for estimation of these volume fractions, and given MVF ...
