Segmented Worms-The Earthworm - Lesson Planet

Segmented worms are coelomates, a kind of animal in which the organs are suspended within a fluid-filled body cavity called a coelom. The coelom is the worm's support structure, and its muscle function is dependent on the amount of fluid in the coelom.

Segmented Worms - All About Worms

The annelids, also known as the ringed worms or segmented worms, are a large phylum, with over 22,000 extant species including ragworms, earthworms, and leeches. The species exist in and have adapted to various ecologies - some in marine environments as distinct as tidal zones and hydrothermal vents, others in fresh water, and yet others in moist terrestrial environments. The annelids are bilaterally symmetrical, triploblastic, coelomate, invertebrate organisms. They also have parapodia ...

Annelid - Wikipedia

An earthworm is a tube-shaped, segmented worm found in the phylum Annelida. They have a world-

wide distribution and are commonly found living in soil, feeding on live and dead organic matter. An earthworm's digestive system runs through the length of its body. It conducts respiration through its skin.
