Correlations, Reliability and Validity, and Linear Regression Correlations A correlation describes a relationship between two variables. Unlike descriptive statistics in previous sections, correlations require two or more distributions and are called bivariate (for two) or multivariate (for more than two) statistics.

Coefficient of determination, in statistics, R^2 (or r^2), a measure that assesses the ability of a model to predict or explain an outcome in the linear regression setting. More specifically, R^2 indicates the proportion of the variance in the dependent variable (Y) that is predicted or explained by linear regression and the predictor variable (X, also known as the independent variable).

The binomial distribution is a discrete probability distribution. It describes the outcome of n independent trials in an experiment. Each trial is assumed to have only two outcomes, either success or failure. If the probability of a successful trial is p , then the probability of having x successful outcomes in an experiment of n independent trials is as follows.
