Constraints , state that the daily manufacturing rate of each type of product is within a pre-defined range during the period for the initial inventory preparation and the period after the construction starts, respectively. The balance of inventory for each kind of product for the whole period of the construction phase in each scenario is bound by constraints , , , , , , .

In probability theory, the multi-armed bandit problem (sometimes called the K-or N-armed bandit problem) is a problem in which a fixed limited set of resources must be allocated between competing (alternative) choices in a way that maximizes their expected gain, when each choice's properties are only partially known at the time of allocation, and may become better understood as time passes or ...

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
