The HEK cell line has been extensively used as an expression tool for recombinant proteins since it was generated over 25 years ago. Although of epithelial origin, its biochemical machinery is capable of carrying out most of the post-translational folding and processing required to generate functional, mature protein from a wide spectrum of both mammalian and non-mammalian nucleic acids.

Genetic engineering is a process that alters the genetic structure of an organism by either removing or introducing DNA. Unlike traditional animal and plant breeding, which involves doing multiple crosses and then selecting for the organism with the desired phenotype, genetic engineering takes the gene directly from one organism and inserts it in the other.

We used CRISPR-Cas9-based genome editing to fuse a 3×-FLAG-affinity tag and APEX2 (hereafter APEX) at the N terminus of the endogenous 53BP1, BRCA1, and MDC1 in U2OS cells (Figure 1A). The FLAG tag was included for affinity purification and MS (AP-MS) of the bait proteins, and APEX was included for in vivo biotinylation-based analysis of bait-proximal networks (hereafter PROX-NET).

Plant genetics is the study of genes, genetic variation, and heredity specifically in Plants. It is generally considered a field of biology and botany, but intersects frequently with many other life sciences and is strongly linked with the study of information systems. Plant genetics is similar in many ways to animal genetics but differs in a few key areas.
