Semiconductor Physics Devices Donald Neamen

A semiconductor material has an electrical conductivity value falling between that of a conductor, such as metallic copper, and an insulator, such as glass. Its resistance decreases as its temperature increases, which is behaviour opposite to that of a metal. Its conducting properties may be altered in useful ways by the deliberate, controlled introduction of impurities ("doping") into the ...

Semiconductor - Wikipedia

An extrinsic semiconductor is one that has been doped; during manufacture of the semiconductor crystal a trace element or chemical called a doping agent has been incorporated chemically into the crystal, for the purpose of giving it different electrical properties than the pure semiconductor crystal, which is called an intrinsic semiconductor. In an extrinsic semiconductor it is these foreign ...

Extrinsic semiconductor - Wikipedia

A semiconductor is a material that imparts current, but only partially. Its conductivity lies between a conductor, which has full conductivity, and an insulator, which has negligible conductivity.

What Are Semiconductors? How Do They Work?

Why is Chegg Study better than downloaded PDF solution manuals? It's easier to figure out tough problems faster using Chegg Study. Unlike static PDF solution manuals or printed answer keys, our experts show you how to solve each problem step-by-step.
