The physical properties of soils, in order of decreasing importance for ecosystem services such as crop production, are texture, structure, bulk density, porosity, consistency, temperature, colour and resistivity. Soil texture is determined by the relative proportion of the three kinds of soil mineral particles, called soil separates: sand, silt, and clay.

Soil - Wikipedia

In this review, the considerations for a surfactant-enhanced soil washing, and the mechanism for the removal of different types of contaminants from soils are summarized and discussed, with purposes of providing an overview of the influence of surfactants' properties on the remediation process and the interactions between soil contaminants and surfactant-containing eluents.

Use of surfactants for the remediation of contaminated ...

Excess nutrients and harmful algal blooms create toxins and compounds in water that pose danger for human health. There are several ways that people (and pets) can be exposed to these compounds. Nitrate, a compound found in fertilizer, can enter drinking water in agricultural areas. A 2010 report ...
