The reactive transport experiments were performed in three columns, in which different pyrite inclusions were embedded in the porous media. The grain size of the pyrite was the same of the surrounding sandy matrix (125–250 μm), thus the column setups consisted of physically homogeneous but chemically heterogeneous porous media.

Enzyme kinetics is the study of the chemical reactions that are catalysed by enzymes. In enzyme kinetics, the reaction rate is measured and the effects of varying the conditions of the reaction are

investigated. Studying an enzyme's kinetics in this way can reveal the catalytic mechanism of this enzyme, its role in metabolism, how its activity is controlled, and how a drug or an agonist might ...
