The changing distance separating the Moon and Earth also affects tide heights. When the Moon is closest, at perigee, the range increases, and when it is at apogee, the range shrinks. Every $7\frac{1}{2}$ lunations (the full cycles from full moon to new to full), perigee coincides with either a new or full moon causing perigean spring tides with the largest tidal range.

Tide - Wikipedia

[[File:|200px|right|A diagram showing the Earth, the Moon, and the Sun. The Earth is in the center, with the Moon to its right and the Sun to its left. The Moon is shown in two positions: one where it is between the Earth and the Sun (labeled 'New Moon') and one where it is on the opposite side of the Earth from the Sun (labeled 'Full Moon'). The diagram illustrates how the gravitational pull of the Moon and the Sun combine to create tides on Earth. The Moon's pull is shown as a vector pointing towards it, and the Sun's pull is shown as a vector pointing towards it. The combination of these two pulls results in the Earth's oceans bulging out on the side facing the Moon and the side facing the Sun, creating high tides. The areas in between experience low tides. The diagram also shows the Earth's rotation and the Moon's orbit around it. The Sun is shown as a large yellow sphere, the Moon as a smaller grey sphere, and the Earth as a blue and white sphere. The labels 'New Moon' and 'Full Moon' are placed near the Moon in their respective positions. The labels 'High Tide' and 'Low Tide' are placed near the Earth's surface to indicate the resulting tidal levels. The diagram is a simple line drawing with a white background. The Earth is a circle with a blue outline and a white interior. The Moon is a smaller grey circle. The Sun is a larger yellow circle. The labels are in a simple sans-serif font. The diagram is oriented horizontally. The Earth is in the center. The Moon is to the right. The Sun is to the left. The labels are placed near the objects they describe. The diagram is a clear and simple illustration of the concept of tides.

Prefixes - Wikipedia

The use of metric prefixes dates back to the inception of the French metric system, in 1793. It was originally decided that the submultiples of all basic units would be prefixed with a Latin root, corresponding to the decimal divisor (deci for 10, centi for 100, milli for 1000), whereas the decimal multiples would be prefixed with a Greek root, corresponding to the decimal multiplier (deca for ...
