Solid-state physics is the study of rigid matter, or solids, through methods such as quantum mechanics, crystallography, electromagnetism, and metallurgy. It is the largest branch of condensed matter physics. Solid-state physics studies how the large-scale properties of solid materials result from their atomic-scale properties. Thus, solid-state physics forms a theoretical basis of materials science.

The glass–liquid transition, or glass transition, is the gradual and reversible transition in amorphous materials (or in amorphous regions within semicrystalline materials), from a hard and relatively brittle "glassy" state into a viscous or rubbery state as the temperature is increased. An amorphous solid that exhibits a glass transition is called a glass.

There is a risk of InGaZnO thin film transistor (IGZO TFT) failure, especially electro-static discharge (ESD) damage of gate driver on array (GOA) circuits, due to the combination of Cu interconnect, InGaZnO (IGZO) active layer and SiN_x/SiO₂ insulating layer used to realize large-scale ultra-high resolution display. It is found that the IGZO TFT damage position caused by ESD occurs between ...

O Nylon-6 apresenta T_g de 47 °C, [24] e o Nylon-6,6, de aproximadamente 70 °C, [25] enquanto o PE pode apresentar T_g variando de −130 a −80 °C de acordo com o método de síntese e o processamento [26] Deve-se ter em mente que esses valores são os mais comuns, visto que a T_g depende da taxa de resfriamento, da distribuição de massa molecular e da presença de aditivos.
