As a reaction is approaching equilibrium describe how the following change. Explain what causes each change. 8. Reactant concentration. As the reaction goes to the right, the reaction concentration decreases. 9. Products concentration. As the reaction goes from left to right, the concentration of the products increases. 10. Forward reaction rate.

temperature causes the equilibrium position to shift in the direction that absorbs heat • If heat is one of the products (just like a chemical), it is part of the equilibrium • so cooling an exothermic reaction will produce more product, and heating it would shift the reaction to the reactant side of the equilibrium: $\text{C} + \text{O}_2(\text{g}) \rightarrow \text{CO}_2(\text{g})$

equilibrium? Answer: Activation energy is the energy barrier to get to the transition state. A catalyst lowers this barrier (thereby increases reaction rate) but has absolutely no effect on the state of equilibrium. 5. What is the rate constant k , and what is the order of reaction if $k = 4 \text{ M}^{-1}\text{sec}^{-1}$ Answer: k is the $Ae^{-E_a/RT}$ part of the rate law.
