2.2. Dielectrics. Dielectric materials, including magnesium oxide (MgO), silicon dioxide (SiO 2), silicon nitride (Si 3 N 4), and spin-on-glass (SOG) are all found to be biodegradable in aqueous solutions [1,27,28]. The kinetics of hydrolysis of these materials depends not only on pH levels, ion concentrations, and temperatures, but also on the density of the films which is determined by the

In the advancement of complementary metal-oxide-semiconductor device technology, SiO 2 was used as an outstanding dielectric and has dominated the microelectronics industry for the last few decades. However, with the recent size downscaling, ultrathin SiO 2 is no longer suitable. ZrO 2 has been introduced as a high-k dielectric to replace SiO 2. This paper reviews recent progress of ZrO 2 thin ...

There are several ways to prepare quantum dots, the principal ones involving colloids. Colloidal synthesis. Colloidal semiconductor nanocrystals are synthesized from solutions, much like traditional chemical processes. The main difference is the product neither precipitates as a bulk solid nor remains dissolved. Heating the solution at high temperature, the precursors decompose forming monomers ...
