Earlier work had shown that DNA is composed of building blocks called nucleotides consisting of a deoxyribose sugar, a phosphate group, and one of four nitrogen bases — adenine (A), thymine (T), guanine (G), and cytosine (C).

# Concept 19 The DNA molecule is shaped like a twisted ladder.

Acids and bases are very useful in our daily lives.Let's start with acids. Without acids, we won't have Vitamin C (ascorbic acid), your car won't start (sulphuric acid in car batteries) or even accelerated rotting of your food (food preservative in the form of citric acid).

The DNA double helix is stabilized primarily by two forces: hydrogen bonds between nucleotides and base-stacking interactions among aromatic nucleobases. In the cytosol of the cell, the conjugated pi bonds of nucleotide bases align perpendicular to the axis of the DNA molecule, minimizing their interaction with the solvation shell. The four bases found in DNA are adenine (A), cytosine (C ...

Learn about the fundamental concepts of chemistry including structure and states of matter, intermolecular forces, and reactions. You'll do hands-on lab investigations and use chemical calculations to solve problems. Note: Save your lab notebooks and reports; colleges may ask to see them before granting you credit.

The solution in ethanol would be unstable. It is best to make solutions up fresh. If this is not possible, divide the solution into aliquots and layer argon or nitrogen over the solution in each vial. Also, the product may be packaged in ampules, or kept in a vial with a cap plug or vacuum seal and stored at -70 ° C. Any antioxidant such as BHT (di-tert-butyl hydroxytoluene) will aid in ...

Humic substances are organic compounds that are important components of humus, the major organic fraction of soil, peat, and coal (and also a constituent of many upland streams, dystrophic lakes, and ocean water). For a long era in the 19th and 20th centuries, humic substances were often viewed through a lens of acid-base theory that described humic acids, as organic acids, and their ...

DNA, short for deoxyribonucleic acid, is the molecule that contains the genetic code of organisms. This includes animals, plants, protists, archaea and bacteria. DNA is in each cell in the organism and tells cells what proteins to make. Mostly, these proteins are enzymes. DNA is inherited by children from their parents. This is why children share traits with their parents, such as skin, hair
