Deep learning in neural networks: An overview - ScienceDirect

Introduction Artificial neural networks are relatively crude electronic networks of neurons based on the neural structure of the brain. They process records one at a time, and learn by comparing their classification of the record (i.e., largely arbitrary) with the known actual classification of the record. The errors from the initial classification of the first record is fed back into the ...

In "Learning the Depths of Moving People by Watching Frozen People", we tackle this fundamental challenge by applying a deep learning-based approach that can generate depth maps from an ordinary video, where both the camera and subjects are freely moving. The model avoids direct 3D triangulation by learning priors on human pose and shape from data.
