Solution Of The Finite Group

In mathematics, a group is a set equipped with a binary operation that combines any two elements to form a third element in such a way that four conditions called group axioms are satisfied, namely closure, associativity, identity and invertibility.One of the most familiar examples of a group is the set of integers together with the addition operation, but groups are encountered in numerous ...

An abelian group is a set, A, together with an operation • that combines any two elements a and b to form another element denoted a • b.The symbol • is a general placeholder for a concretely given operation. To qualify as an abelian group, the set and operation, (A, •), must satisfy five requirements known as the abelian group axioms: Closure
