A special right triangle is a right triangle with some regular feature that makes calculations on the triangle easier, or for which simple formulas exist. For example, a right triangle may have angles that form simple relationships, such as 45°–45°–90°. This is called an "angle-based" right triangle.

which is an integer whenever and are integers (Ogilvy and Anderson 1988, p. 68).. Given a right triangle , draw the altitude from the right angle.Then the triangles and are similar.. In a right triangle, the midpoint of the hypotenuse is equidistant from the three polygon vertices (Dunham 1990). This can be proved as follows. Given , let be the midpoint of (so that).

Triangles are assumed to be two-dimensional plane figures, unless the context provides otherwise (see Non-planar triangles, below).In rigorous treatments, a triangle is therefore called a 2-simplex (see also Polytope).Elementary facts about triangles were presented by Euclid in books 1–4 of his Elements, around 300 BC.

The reason these triangles are considered special is because of the ratios of their sides - they are always the same! Special right triangles hold many applications in both geometry and trigonometry.. In this lesson you will learn the general formula for the ratios, and how to find missing sides of any 30 60 90 right triangle.

A right triangle with the two legs (and their corresponding angles) equal. An isosceles right triangle therefore has angles of 45 degrees, 45 degrees, and 90 degrees. For an isosceles right triangle with side lengths a, the hypotenuse has length sqrt(2)a, and the area is A=a^2/2. The hypotenuse length for a=1 is called Pythagoras's constant.

Note: Which leg is a or b is irrelevant in the use of the Pythagorean Theorem. Note: The Pythagorean Theorem only works for right triangles. Putting the formula into words, the square of the length of one leg plus the square of the length of the other leg equals the square of the long-side opposite the right angle.

One of several centers the triangle can have, the circumcenter is the point where the perpendicular bisectors of a triangle intersect. The circumcenter is also the center of the triangle's circumcircle - the circle that passes through all three of the triangle's vertices.As you reshape the triangle above, notice that the circumcenter may lie outside the triangle.
