Zeno's paradoxes are a set of four paradoxes dealing with counterintuitive aspects of continuous space and time. 1. Dichotomy paradox: Before an object can travel a given distance d, it must travel a distance d/2. In order to travel d/2, it must travel d/4, etc. Since this sequence goes on forever, it therefore appears that the distance d cannot be traveled.

Separation of variables is a method of solving ordinary and partial differential equations. For an ordinary differential equation $(dy)/(dx)=g(x)f(y)$, (1) where $f(y)$is nonzero in a neighborhood of the initial value, the solution is given implicitly by $int(dy)/(f(y))=intg(x)dx$. (2) If the integrals can be done in closed form and the resulting equation can be solved for y (which are two pretty ...

In mathematics and physics, a brachistochrone curve (from Ancient Greek βράχιστος χρόνος (brákhistos khrónos), meaning 'shortest time'), or curve of fastest descent, is the one lying on plane between a point A and a lower point B, where B is not directly below A, on which a bead slides frictionlessly under the influence of a uniform gravitational field to a given end point in ...

Open questions Mathematics is something of an extreme case. In most other sciences, new theories and ideas tend to replace older ones. Hence in most sciences work that was done long ago (exactly how long depending on the particular science) is usually superceded by work done as recently as a few decades ago, or less.

In mathematics, and in particular linear algebra, a pseudoinverse $A +$ of a matrix A is a generalization of the inverse matrix. The most widely known type of matrix pseudoinverse is the Moore–Penrose inverse, which was independently described by E. H. Moore in 1920, Arne Bjerhammar in 1951, and Roger Penrose in 1955. Earlier, Erik Ivar Fredholm had introduced the concept of a pseudoinverse of ...
