Rates of change and the slope of a curve . To see another way in which the derivative appears, let's go back to our earlier discussion about making measurements. Recall that we looked at a graph that describes the result of some scientific observation (the measurement of the value of the variable y at different times t).

In mathematics, a rate is the ratio between two related quantities in different units. If the denominator of the ratio is expressed as a single unit of one of these quantities, and if it is assumed that this quantity can be changed systematically (i.e., is an independent variable), then the numerator of the ratio expresses the corresponding rate of change in the other variable.

Rate (mathematics) - Wikipedia

Expressed as a ratio between change in variables over a specific period of time. Can be represented graphically with the slope of a line, or illustrated with the Greek letter delta. Stock traders rely on the speed of change of one stock price relative to another stock's price.

What is rate of change? definition and meaning ...
The slope of a line in the plane containing the x and y axes is generally represented by the letter m, and is defined as the change in the y coordinate divided by the corresponding change in the x coordinate, between two distinct points on the line. This is described by the following equation: = = =. (The Greek letter delta, Δ, is commonly used in mathematics to mean "difference" or "change".)

In this section we will introduce two problems that we will see time and again in this course : Rate of Change of a function and Tangent Lines to functions. Both of these problems will be used to introduce the concept of limits, although we won't formally give the definition or notation until the next section.

We write dx instead of "Δx heads towards 0".. And "the derivative of" is commonly written :. x 2 = 2x "The derivative of x 2 equals 2x" or simply "d dx of x 2 equals 2x". What does x 2 = 2x mean?. It means that, for the function x 2, the slope or "rate of change" at any point is 2x.. So when x=2 the slope is 2x = 4, as shown here:. Or when x=5 the slope is 2x = 10, and so on.
